AUTHOR: Savchenko, A. A.

TITLE: Investigation of contact thermometers

CITED SOURCE: Tr. In-ta fiz. Zemli AN SSSR, no. 29 (196), 1963, 134-141

TOPIC TAGS: contact thermometer, gravimeter, thermostat, thermistor, resistance thermometer

TRANSLATION: This article describes a device designed for the investigation of the principal parameters of contact thermometers (temperatures of closing T_{clos} , temperature of opening T_{open} and the region of nonsensitivity of the contact thermometer h), used in the thermostats of the SN-3 and GAK gravimeters. For determination of T_{clos} and T_{open} the investigated thermometers were placed in a TS-15 thermostat filled with transformer oil in which the temperature can be changed periodically at a prescribed interval. In addition to the contact thermometers, a thermistor is placed in the thermostat; the thermistor is a low-inertia sensor in the circuit of a resistance thermometer. During the experiments two series of contact thermometers were investigated, an overflow type and a type

with a constant contact. . The author gives the results of determination of T_{clos} and T_{open} for both types of thermometers for a rate of temperature change from 0 to 20 millidegrees/sec and also the derived values $h = T_{clos\ 0} - T_{open\ 0}$, where $T_{clos\ 0}$ and $T_{open\ 0}$ are T_{clos} and T_{open} for virtually zero rates of temperature changes (0.02°C for thermometers with a constant contact and 0.03-0.04°C for overflow thermometers). TITLE: Spacecraft heat shielding 15

SOURCE: Aviatsiya i kosmonavtika, no. 3, 1965, 30-33

TOPIC TAGS: spacecraft, reentry vehicle, reentry heating, ablative heat transfer,
quartz

ABSTRACT: The authors discuss ablation and the ablative heat shielding of reentry vehicles and make a general comparison of laminated plastics, fillers, resins, ablation rates, and various reinforcing agents. Emphasis is placed on the use of quartz and ceramic fibers in reinforced plastics, as well as recently developed graphite fibers which possess great strength at up to 2500° C. Mention is made of U. S. interest in organic "pluton" fiber and the proposed use of sitalls which have constant dielectric properties and which pass decimeter radiowaves. While much of the article is obviously from non-Soviet sources, it may well be that some of the

TITLE: A method for the accurate investigation of contact thermometers

SOURCE: AN SSSR. Institut fiziki Zemli. Apparatura i metody morskikh gravimetricheskikh nablyudeniy (Apparatus and methods of marine gravimetric observations).
Moscow, Izd-vo Nauka, 1965, 18-25

TOPIC TAGS: thermometry, test instrumentation, thermometer, thermostat, precision instrument

ABSTRACT: Accurate operation of precision relay thermometers depends on the accuracy of contact thermometer sensors. The Department of Experimental Gravimetry of the Institute of Physics of the Earth, AN SSSR (Otdel eksperimental'noy gravimetrii Instituta fiziki Zemli AN SSSR) earlier developed the appropriate equipment (V. A. Tulin, Trudy In-ta fiziki Zemli AN SSSR, No. 31, 1964) for testing contact thermometer sensors. The purpose of the present article is to discuss some of the methods related to the investigations and processing of the experimental data. A description is given of modifications of the original equipment, and of a method

Card 1/2

L 36121-66

ACC NR: AT6006259

for the simultaneous testing of 6 thermometers within water-operating thermostats. Detailed data concerning the operation of the specially designed thermostats are provided. An analysis of the results shows that the best results are obtained with thermostats with forced cooling and a liquid (mixable) heat-carrying medium; the heating and forced cooling must be sufficiently strong to suppress outside influence. The test thermometers should not be moved relative to the heater, and several thermometers should be studied simultaneously to avoid systematic effects. The new device secures a high accuracy (an average quadratic error per measurement of no more than $\pm 0.003^{\circ}\text{C}$). It is noted that it is not the true temperature that is measured, but only its variations relative to the scale of a standard thermometer. Orig. art. has: 4 figures.

TITLE: Protection from light radiation

B

SOURCE: Tekhnika i vooruzheniye, no. 7, 1966, 24-27

TOPIC TAGS: nuclear warfare, nuclear blast effect, nuclear safety, light radiation

ABSTRACT: Various protective measures against harmful effects of light rays radiated by nuclear bomb explosions are discussed. The results of heat effect produced by light radiant energy on various combustible materials (wood, textiles, rubber, etc.) are presented in a table. They are expressed in cal/sq cm for destructive and partial (charcoal) burnings at various distances from the explosion epicenter. A blast in the air produces the strongest light radiation especially if the blast takes place below clouds and above water and snow surfaces. In general, the protective measures are similar to the measures which are usually taken in fire-fighting practice. Scattering of fuel depots on airfields, an adequate spacing between buildings (at least 50 m), use of fire-proof materials and coatings, removal of dry wood in forests, providing clearings and other similar means of protection are recommended. The use of protective smoke formed by condensation of petroleum vapors or by combustion of various materials can diminish injuries by dispersing or

Card 1/2

L 46124-66

ACC NR: AP6024898

absorbing light rays. The use of natural and artificial shelters for protection of troops, weapons, vehicles and other equipment is discussed including the use of various surface depressions, trees, woods as well as the construction of shelters, trenches and other artificial devices. Various means for concealing vehicles and equipment are recommended. An effective protection of personnel can be arranged only in closed shelters. The protective properties of uniform and underwear are also examined and some recommendations for protection of the human body are presented. Orig. art. has: one table.

"Synthesis and Conversions on Pyrimidine Derivatives. III. Studying the Mobility of the Hydrogen Atoms in the Methyl Group of Monoxydihydropyrimidine Derivatives," N. V. Khromov-Borilov, A. M. Savchenko, First Leningrad Med Inst imeni Acad I. P. Pavlov

"Zhur Obshch Khim" Vol 22, No 9, pp 1680-1692

The activity of the methyl group in monoxydihydropyrimidines was studied. This group, highly active in the compds studied, enables condensation with aldehydes and diazo compds. It was shown that dihydropyrimidines prep'd by condensation are an equil mixt of tautomers (desmotropes). The structural formula for dihydropyrimidines proposed by Biginelli does not explain the activity of the methyl group. Some tautomers were removed in the free state (not brominated). When these were boiled in alc., benzene, or glacial acetic acid, they were converted into the equil mixt of tautomers of const. compn. It was shown that the active methyl group is present in only one tautomeric form of dihydropyrimidines. The proposed structural formula for this tautomer explains the activity of the methyl group in the dihydropyrimidines studied.

TITLE: Investigation of secondary punch-through in transistors					
SOURCE: Radiotekhnika i elektronika, v. 10, no. 7, 1965, 1325-1327					
TOPIC TAGS: transistor punch through, secondary punch through, transistor breakdown, alloy transistor, diffusion alloy transistor, germanium transistor/P16 transistor, P416 transistor					
ABSTRACT: The phenomenon of secondary punch-through was investigated in alloy germanium transistors and diffusion-alloy germanium transistors. The transistors were altered to impair heat transfer from the collector junctions in order to aid the development of secondary punch-through. A rectangular current pulse with a height of 0.05—1.0 amp and a duration of 0.1—1.5 msec was fed through the transistors. The base terminal was not connected in the circuit, and the voltage between the collector and emitter was observed with an oscilloscope. In a majority of the transistors tested, a sudden drop in voltage occurred at the instant of secondary punch-through.					
Card 1/2					

L 60837-65

ACCESSION NR: AP5017670

through 5—20 μ sec after the start of the current pulse. In some of the specimens, the voltage drop occurred twice, with collector-emitter voltage dropping to 8—30 v and then to 2—5 v. The first drop corresponded to the development of secondary punch-through; the second was ascribed to "tertiary" punch-through, which is the result of the sequential formation of two or more channels of local heat breakdown similar to the sequential "igniting" of microplasma regions during the breakdown of nonhomogeneous junctions. The effect of a 15-koe magnetic field on the development of secondary punch-through was also studied. It was found that the delay time in alloy transistors varies greatly when the magnetic field intensity and orientation are varied. When the magnetic field was perpendicular to the collector-emitter axis, delay time increased several times. If a pulse duration is chosen which is shorter than the delay time at a certain value of magnetic field intensity, the punch-through state in the transistor may be turned on and off by varying the magnetic field. The orientation of the magnetic field had no marked effect on the values of diffusion-alloy transistors. Orig. art. has: 2 figures.

TITLE: Intensifying Breakdown Operations in Rolling Heavy Sheet (Intensifikatsiya rezhimov obzhatiya pri prokatke tolstykh listov)

PERIODICAL: Sb. nauchn. tr. Zhdanovsk. metallurg. in-t, 1957, Nr 4,
pp 126-142

ABSTRACT: Experimental rolling (R) and study of existing breakdown schedules (B) for thick sheets of the major sizes, types, and grades of steel on the Nr-1 mill of the im. Il'ich plant make it possible to define the unused power and available energy of the mill during the initial period of R of 8.8x2095 mm and 10.8x2085 mm Nr-3 steel sheets, and also to determine unused biting capacity of the rolls. These factors are used to develop and recommend new, more intensive B schedules, envisaging a considerable increase in B during the first passes, with the present deformation ratios being retained essentially at the end of B. The B of sheets of different types and dimensions was performed in 21-23 passes as against 27-31 passes under the

TITLE: A Contribution to the Problem of Determination of Pressures
and Torque Moments in Rolling Mills (K voprosu ob opredelenii davleniy i krutyashchikh momentov na prokatnykh stanakh)

PERIODICAL: Izv. vyssh. uchebn. zavedeniy. Chernaya metallurgiya, 1958,
Nr 1, pp 138-143

ABSTRACT: An examination is made of the operating conditions of resistance strain gages (SG) pasted onto rolling-mill spindles. These are compared to the operating conditions for similar SG pasted onto a calibration beam. It is shown that a wire SG attached to the surface of a spindle at 45° to its axis is subjected to a state of plane stress (PS) when the spindle is subjected to torque. The constantan SG usually employed have a tensile sensitivity range of 2.1-2.3 and function differently under conditions of linear and plane S. Therefore, given identical degrees of SG strain on the beam and the spindle, the strains causing them prove to be different. It is determined by experiment that the stress on the spindle is 75% of that on the beam. It is

Card 1/2

SOV/137-58-9-18985

A Contribution to the Problem of Determination of Pressures (cont.)

shown that the correction factors of 0.9 to 1 recommended in the literature are erroneous. Therefore, it is shown that in order to determine torque moments under conditions of industrial operation, the calibration of wire SG must be done on special models, the nature of the S on the surface of which corresponds to the nature of the S on the surface of the shaft being subjected to torque. It is observed that the accuracy of measurement of the roll-separating pressure by attaching a pick-up to the housing depends upon the point at which the pick-up is bonded.

AUTHOR: Savchenko, A. M.

TITLE: Determination of the capacity of three-high sheet rolling mills and the control of its loading

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 7, 1961, 6-7, abstract 7D37 ("Tr. Konferentsii: Tekhn. progress v tekhn. prokatn. proiz-v". Sverdlovsk, Metallurgizdat, 1960, 510-525)

TEXT: A theoretical calculation of the capacity of the sheet rolling mills 2540 and 2100 of the plant imeni Il'ich was carried out. The method of calculation is worked out on the basis of the analysis of the rolling schedules, and the power and energy characteristics of rolling on these mills. Verification of the calculated data was carried out by oscillographic timing of the mill operation while rolling the most widespread types and sizes of sheets. The calculated and experimental results were in a satisfactory agreement. A check of the correctness of mill loading, carried out by comparing the rated and actual capacities and by comparing the calculated required rolling time with the actual time, uncovered the existing possibilities of increasing the mill capacity.

TITLE: Improved Reduction Conditions on a Reversing Thick-Sheet Mill at
Insufficient Power of the Main Motor

PERIODICAL: "Sb.nauchn.tr.Zhdanovsk. metallurg. in-t", 1960, No.5, pp.257-263

TEXT: The authors analyze factors determining the permissible reduction in the rolling of sheets and plates on a reversing 1,200x4,450 mill. It is established that the factor, limiting the reduction, is insufficient power of the drive motor. Under these conditions it is recommended to perform the metal grip by the rolls not at the time of speeding-up the motor, which requires the expenditure of the dynamical torque component, but after the rolls have attained the rated rotation speed; to accelerate the speed of rolls the time of pauses should be used..

TITLE: Determination of thermo-physical properties of a
titanium alloy 48-OT-3 (48-OT-3)

PERIODICAL: Tsvetnyye metally, 1961, No.8, pp. 73-79

TEXT: Knowledge of the thermo-physical properties of metals
and alloys is necessary in selecting both the rational heating
schedules during various fabrication processes and the optimum
operating conditions for components subjected to variations in the
ambient temperature. The object of the present investigation was
to determine the thermal conductivity (λ , kcal/m h °C), specific
heat (C, kcal/kg °C), and the thermal diffusivity (a, mm²/h)
($a = \lambda/C\gamma$, where γ is the density of the material) of the
48-OT-3 Ti-base alloy. This alloy contained 3.5-4.0% Al, not more
than 0.1% nitrogen, 0.1% oxygen and traces of hydrogen. The
measurements were carried out at temperatures ranging from 100 to
1025 °C. The magnitude of a and C only was determined;

Card 1/9

Determination of thermo-physical ...

λ was calculated from these data ($\lambda = aC\gamma$), the appropriate correction being applied for the thermal expansion of the alloy. The bulk of the paper is devoted to a detailed description of the experimental technique and equipment used. A technique developed by N.Yu. Tayts and E.M. Gol'dfarb (Ref. 2: Zavodskaya laboratoriya, 1950, No. 3) and based on a method proposed by G.M. Kondrat'yev (Ref. 1: Teplovyye izmeneniya (book "Thermal Changes"), Mashgiz, 1957) was used by the present authors for the determination of a . The method consists in solving the differential equation of the thermal diffusivity for a slab heated at a constant rate. If the temperature gradient between the surface and the axis of a cylindrical slab at the initial moment is Δt_0 , then

$$\frac{\Delta t}{v \tau} = \frac{R^2}{4a\tau} - \left(\frac{R^2}{a\tau} - \frac{4(\Delta t_0)}{v\tau} \right) \Phi \left(\frac{a\tau}{R^2} \right) \quad (1)$$

where: v is the constant heating rate ($^{\circ}\text{C}/\text{h}$); τ is the time (h); a is the thermal diffusivity (mm^2/h); and $\Phi(a\tau/R^2)$ is the function of the Fourier criterion. In practice, this method consists in measuring the temperature on the surface and in the

Card 2/ 9

E193/E135

Determination of thermo-physical

interior of a specimen (cylindrical in the present case), heated at a constant rate in a specially designed furnace with low thermal inertia. From the measured temperature gradient at the beginning and end of each heating interval, and from the known heating rate, $\Delta t_o/vr$ and $\Delta t/vr$ are calculated, after which the average value of a is determined. The advantage of this method consists in that the formulae employed do not depend on the external heat transfer conditions. The method used in the present investigation for determining C is based on the principle of heat balance and has been developed by "Gintsvetmet". It is best described with reference to Fig.4, which shows the experimental assembly comprising the following items: 1, the material tested; 2 and 3, screening vessel and its lid; 4, electric furnace; 5, furnace cover; 6, portable potentiometer; 7, resistance box; 8, step-down transformer; 9, mirror galvanometer; T_o , thermocouple measuring the temperature at the specimen axis; T_c and T_{Π} , differential thermocouple housed in the screening vessel wall. A constant quantity of heat per unit time is supplied to the specimen, and the temperature t_o at the specimen axis is measured as well as the temperature gradient, Δt , across the screening vessel wall.

Card 3/9

25937

S/136/61/000/008/005/005

Determination of thermo-physical ... E193/E135

once on the material studied, the weight of the test piece in this case being w_3 . Three heat balance equations are obtained in this manner for each of the temperature intervals selected, and from these the formula for the heat content of the material studied is derived in the form of:

$$i_3 = \frac{i_2 w_2 - i_1 w_1}{w_3} \left(\frac{\Delta t_3 z_3 - \Delta t_1 z_1}{t_2 z_2 - t_1 z_1} \right) + \frac{i_1 w_1}{w_3} \quad (4)$$

Since it was found that the temperature-dependence of heat content of copper was not linear, nickel was used as the standard material in the present investigation. The results of the measurements of thermal diffusivity of the 48-OT-3 alloy are given in Table 1, under the following headings: 1) alloy temperature, $^{\circ}\text{C}$; 2) a , m^2/h . The results of the specific heat measurements are tabulated and also reproduced graphically in Fig. 6, where the specific heat C ($\text{kcal/kg } ^{\circ}\text{C}$) is plotted against the temperature ($^{\circ}\text{C}$), curve 1 showing the actual C at a given temperature, and curve 2 showing the average C for any 20 $^{\circ}\text{C}$ to t_0 temperature interval. Finally,

TITLE: Investigation of extra-contact of deformation zones during rolling

PERIODICAL: Referativnyy zhurnal, Mekhanika, no. 3, 1963, 32, abstract 3V218 (Sb. nauchn. tr. Zhdanovsk. metallurg. in-t, 1962, no. 8, 5-19)

TEXT: Boundaries of extra-contact zones of elastic-plastic deformation under different conditions of rolling have been established experimentally with the aid of wire transducers. The stresses in a strip of a very plastic metal on the side of emergence cross-section do not exceed the yield limit. At the same time, the extra-contact zones on the side of entrance plane of the focus have a complicated character, and the stresses there reach the yield limit. The increase of strength of the rolled metal, decrease of the friction coefficient in the contact of metal with rolls and the decrease of flattening-out width reduce the length

Card 1/2

Investigation of extra-contact ...

S/124/63/000/003/052/065
D234/D308

of the extra-contact zone. The stressed state of the metal within the limits of extra-contact zones is nearly plane. The magnitude of longitudinal deformation registered by the transducers can be used in constructing the diagrams of longitudinal velocities of metal particles in any cross-section plane of the strip within the extra-contact zone. In the present experiments the difference with longitudinal velocities of particles at the entrance plane of the focus reached 1%. /⁻Abstracter's note: Complete translation.

S/124/63/000/004/051/064AUTHOR: Savchenko, A. M.TITLE: The character of deformation in rolling metals in a state of high plasticityPERIODICAL: Referativnyy zhurnal, Mekhanika, no. 4, 1963, 29, abstract 4V229
(Sb. nauchn. tr. Zhdanovsk. metallurg. in-t, vyp. 8, 1962, 32-38.)

TEXT: The author gives the results of an experimental study of the character of deformations in the rolling of steel and lead, and also of the influence of the bandwidth at the penetration depth of the deformation. Rolled lead slabs were prepared on laboratory mill 125; steel ingots on a plate mill with nominal diameter of rollers of 1,250 mm. These are the author's conclusions: 1. Metals possessing sufficiently high plasticity uniformly show the character of plastic deformation upon rolling. Therefore the results obtained on the lead samples characterize phenomena occurring in the rolling of low-carbon steel. 2. With identical plasticity throughout the entire volume of a metal, the depth of distribution of the zone of plastic deformation under high stress largely depends upon the width of the rolling. L. A. Rubenkova.

Orig Pub : Byul. In-ta biol., AN BSSR, vyp 2, 1956 (1957), 34-39

Abstract : There are over ninety grape varieties in Belorussia and the greatest areas of grape cultivation are in the Gomel' and Brest oblasts, where they are more than just amateur enterprises. Economical and biological characteristics of 30 sample-varieties were studied at the Botanical Garden of Acad. Sci., BSSR in 1953-1956. The stable varieties are: Madeleine Anjevine, Early Malingre, Pearl of Saba, Malingre seedling, Sweet Black and others. The winter resistance of eyes at the base of sprouts is lower in the majority of varieties than in

TITLE: Male sterility in plants caused by penetrating radiation

SOURCE: AN BSSR. Doklady, v. 9, no. 3, 1965, 202-204

TOPIC TAGS: radiobiology, gamma ray, cobalt 60, radiation effect, seed, plant genetics

ABSTRACT: It is a laborious and costly process to obtain hybrid seeds by the usual method of flower castration. The authors studied the possibility of inducing male sterility in plants by irradiating air-dried cucumber, rye, wheat, tomato, radish and other seeds with gamma rays from Co⁶⁰ in the atomic reactor of the AN BSSR. Critical doses for each species of plants were used. A relationship was noted between sterility and the radiation dose in the case of mustard, cabbage, cucumber, and rape. In corn and beans, some varieties were less sensitive than others to the same radiation dose. Pollen was found to be sterile in non-irradiated plants, indicating that male sterility may be due to some other factors. In

Card 1/2

L 55133-65

general, however, the results of the experiments showed that irradiation of seeds increases pollen sterility so that joint planting of an irradiated maternal variety with a non-irradiated paternal variety increases the hybridity of the seeds. Orig. art. has: 4 tables.

AUTHOR: Savchenko, A.P.

TITLE: A generator of series of sinusoidal signals

PERIODICAL: Tekhnika kino i televideniya, no. 9, 1961, 59-62

TEXT: The author describes a generator of series of sinusoidal signals - ГССС (GSSS), designed and constructed at the GTTs, for measuring the frequency response of the video channel at TV centers. The generator operates by sending a test signal consisting of several small series of sinusoidal signals into the input of the channel that is to be tested. The signal series have fixed frequencies and are disposed along each scanning line in an ascending order of frequency. The signal can contain both blanking and synchronizing pulses. The frequency response of the channel can thus be quickly evaluated according to the relative height of the sinusoidal signal bursts on the test's signal's oscilloscope, which can be observed on a wide-band oscilloscope. A mixture of blanking pulses with double amplitudes of the order of 5 must be fed to the generator from the TV center's

Card 1/2

26537
S/187/61/000/009/002/002
D035/D112

A generator of series...

synchro generator. The GSSS consists of an electronic commutator unit and a high frequency generator unit. The latter consists of 6 generators and a video amplifier which is used for mixing and limiting the blanking pulses. During one line period the high frequency generator unit produces six series of pulses with frequencies of 1, 2, 3, 4, 5 and 6.5 mc/s. The amplitude of these series is controlled by 6 individual controllers and summed on a common bus at the video amplifier's input. The double amplitude of the test signals is controlled by a variable resistor which at a load of 75 ohms can be varied from 0.3 to 5 v. Operational experience showed that the generator can be used for channels of any length, which is of particular value for measurements on radio relay trunk systems. After slight conversion of the TV center's oscilloscopes the bursts can be checked immediately on the latter. The test signal can be mixed into the TV signal, i.e. one of the scanning lines can be used, thus permitting measurements to be conducted during transmission. The generator received a prize in a competition conducted by the Radioupravleniye Ministerstva svyazi RSFSR (Radio Administration of the Ministry of Communications of the RSFSR) in 1960. There are 3 figures.

TITLE: Morphological and biological changes in plants induced by gamma rays

SOURCE: AN BSSR. Doklady, v. 9, no. 5, 1965, 340-343

19

TOPIC TAGS: gamma ray, radiation plant effect, plant chemistry

ABSTRACT: Critical and sublethal doses of gamma rays stunted the growth of tomatoes, cucumbers, cabbage, mustard, radishes, beans, beets, and onions. Seeds exposed to such doses germinated 1-14 days later than did the control. Subsequent development was also slower. These doses likewise altered the plants' morphology, particularly the leaves. However, all the changes gradually disappeared by the time the plants flowered, indicating that plants recover at a certain stage of development, even after receiving very high doses of radiation. Irradiation also affected the biochemical composition of the plants. For example, it reduced the fat content of mustard and cabbage seeds below that of the control.

Low doses of gamma rays, on the other hand, had a stimulating effect. They hastened the ripening of the fruits and increased the plants' productivity. This paper was presented by Academician AN BSSR A. R. Zhebrak. Orig. art. has:

TITLE: Kinetics of photoconductivity in semiconductors with minority carrier capture levels on the surface

SOURCE: Ukrayins'kyj fizychnyy zhurnal, v. 10, no. 3, 1965, 275-286

TOPIC TAGS: semiconductor, minority carrier, photoconductivity, capture level, surface state

ABSTRACT: The dependence of photoconductivity on the modulation frequency and on the semiconductor parameters is determined for the case of sinusoidally modulated and strongly absorbed light. Account is taken of the bending of the bands at the surface, due to the existence of several surface levels. It is assumed that capture of minority carriers and adhesion of majority carriers on the surface are possible. The problem is solved in the linear approximation under several simplifying assumptions. The expression obtained is the sum of the bipolar photoconductivity and the monopolar photoconductivity. The contributions of these two

components are different for different bending of the bands and depend on the ratio of the lifetimes of the carriers in the bands and at the surface levels. An analysis of several limiting cases is presented. The nonstationary photoconductivity produced in the case when strongly absorbed light produces carriers of both signs is considered for sinusoidally modulated light, and the dependence of the complex photoconductivity on the frequency of modulation and on the parameters of the semiconductor is determined. The results show that the frequency dependence of the photoconductivity depends appreciably on the ratio between the volume and surface parameters of the semiconductor and can vary in proportion to the frequency raised to negative powers $1/2$, 1 , $3/2$, or 2 . The transition from one type of fall-off to the other depends on the semiconductor parameters. It is also shown that, depending on the surface kinetic parameters, carriers of any one polarity can accumulate on this surface. The expressions obtained can be used to interpret photoconductivity-kinetics experiments in which the surface has a strong effect, and also to determine the parameters of the surface centers. "The authors thank Candidates of Physical Mathematical Sciences V. G. Litovchenko and O. V. Smitko for interest in the work." Orig. art. has: 3 figures and 41 formulas.

Determination of para isomers in the mixtures of chloroanilines and nitrochlorobenzenes. K. G. Miznich and A. Ya. Savchenko. *Analitika i rascheta*. 4, 201-5 (1934).
 To det. p -ClC₆H₄NH₂, in the presence of σ -ClC₆H₄NH₂, dissolve 0.15-0.5 g. of the mixt. in 75 cc. of anhyd. redistd. Et₂O, add with stirring (if necessary) 25 cc. 5% H₂C₂O₄ in Et₂O, filter through a Schott glass filter, wash the ppt. with 50-75 cc. of 5% H₂C₂O₄ in Et₂O, dissolve the ppt. in hot H₂O, dil. to 250 cc., cool to 5-10°, add 10 cc. 20% KBr and titrate with 0.3 N KBrO₃. The accuracy of the method is within 0.1-0.2%, depending on the quantity of the para isomer in the mixt. To det. p -ClC₆H₄NO₂ in the presence of σ -ClC₆H₄NO₂, dissolve 0.5-1 g. of the mixt. in 10 cc. Et₂O in a 250 cc. Erlenmeyer flask provided with a glass tube condenser 80 cm. long and a short glass tube sealed with a clamped rubber tubing, add 60 cc. H₂O and 8-10 cc. concd. HCl and then, carefully, Zn dust, boil 15 min., transfer the mixt. to a flask, make up with H₂O to 250 cc., remove 50 cc., make slightly alk. to litmus, ext. the amines with Et₂O, dry, filter through a dry filter, wash the filter with anhyd. Et₂O, dil. with Et₂O to 75 cc. and proceed as above. The accuracy of the method is within 1.5-2% of the para isomer.

Title : Determination of Fluorine in Organic Compounds

Orig Pub : Zh. analit. khimii, 1955, 10, No 6, 355-357

Abstract : Description of the method of determination of F in organic compounds containing Cl, N and S. A 20-25 mg sample is decomposed by heating with metallic K in a Ni-bomb, at 900-950°. The F⁻ thus formed is determined by titration with a solution of ZrOCl₂ in the presence of sodium alizarin sulfonate.

TITLE: Plastic Parts Making (Izgotovleniye detaley iz plastmassy)

PERIODICAL: Radio, 1957, Nr 7, pp 54-55 (USSR)

ABSTRACT: Plastic parts for amateur radio equipment, like insulating coil forms, etc., can be "very simply" made out of polymethyl methacrylate AKR-7, which is widely used in dentistry work in the Soviet Union. The AKR-7 material consists of a powder (polymer) and a fluid (monomer). Mixed together in a closed jar the ingredients form a paste in 10 to 20 minutes. The paste is packed into a prepared mold, and is boiled, together with the mold, in water for 30 minutes which results in the solidification of the paste. The mold is either broken (gypsum) or split into two halves (metal) to release the plastic part. Detailed instructions are given how to prepare a gypsum or alabaster mold, including mixing, stirring, positioning of the model, assembly keys, metal bolts to be integrated with the plastic part, etc. Detailed instructions are also given for preparation of metal molds. It is recommended to use an alloy of a "low-melting denture metal" (two parts or more) and lead (one part or less).

Four figures illustrate various stages of molding and casting work.
